

FUSED PASSIVE ORGANIC LIGHT EMITTING DISPLAYS

Abstract of the Disclosure

An organic light emitting device display may include transverse row and column lines. In a passively driven
5 OLED display, a fuse may be positioned between the OLED material and the row electrode. When a short occurs, the single pixel may be separated from the circuit by the fuse, avoiding the possibility that an entire row of pixels may be adversely affected by the short associated with one
10 single pixel along a row.
